

## ConvertIQ : Smart Conversion Dashboard

**ConvertIQ** is a web analytics-based Power BI dashboard where I analyzed user behavior, traffic sources, and conversion performance.

The main focus of this dashboard is to understand how users interact with a website, which traffic sources perform better, and what factors impact conversions.

I used key metrics like sessions, users, bounce rate, and conversion rate to provide a clear view of overall performance.

(fig1: Web analytics overview of conversions, traffic sources, and user engagement)

### Objective

- To analyze **user behavior** and understand how users interact with the website
- To evaluate performance across different **traffic sources** (Organic, Direct, Paid, Referral)
- To track and measure key **conversion metrics** such as conversion rate and funnel drop-offs
- To identify key factors like **bounce rate** and **engagement** that influence conversions
- To provide **data-driven insights** for improving overall website performance

### Dataset Information

The dataset used in this project is based on web analytics data, representing user interactions and website performance metrics.

It includes information related to user activity, traffic acquisition, engagement, and conversions.

### Key Data Fields

- **Date** – Used for analyzing trends over time

- **Users** – Number of unique visitors
- **Sessions** – Total number of visits
- **Traffic Source** – Channels like Organic, Direct, Referral, and Paid
- **Bounce Rate** – Percentage of users leaving without interaction
- **Conversion Rate** – Percentage of users completing a desired action
- **Engagement Metrics** – Measures like session duration or interaction level

## Data Source

The dataset was downloaded from [Kaggle](#) and uploaded to my [GitHub](#) repository for project reference and version control.

## Tools & Technologies

- **Microsoft Power BI** – For building interactive dashboards and data visualization
- **Power Query** – For data cleaning and transformation
- **DAX (Data Analysis Expressions)** – For creating calculated measures like conversion rate
- **Microsoft Excel** – For initial data storage and preprocessing
- **Kaggle** – For sourcing the dataset
- **GitHub** – For project hosting and documentation

## Data Cleaning & Transformation

- Removed **missing/null values** to ensure data accuracy
- Standardized **data types** (date, numeric fields)
- Created calculated measures like **Conversion Rate** using DAX
- Structured and transformed data using **Power Query** for better analysis

## Dashboard Features

- **KPI Cards** – Displays key metrics like Users, Sessions, Conversion Rate, and Bounce Rate for quick overview
- **Conversion Funnel** – Visualizes user journey and identifies drop-off stages in the conversion process
- **Traffic Source Analysis** – Compares performance across Organic, Direct, Referral, and Paid channels
- **Engagement Trends** – Shows user activity over time to identify patterns and peak periods
- **Interactive Filters (Slicers)** – Enables filtering by date and traffic source for dynamic analysis

## Key Insights

- Organic traffic contributes the highest share of users and shows better conversion performance compared to other sources

- Lower bounce rate is directly associated with higher conversions, indicating better user engagement
- The conversion funnel shows significant drop-offs at intermediate stages, highlighting areas for optimization
- Some channels generate traffic but have relatively lower engagement and conversions, indicating quality issues
- User activity trends show variation over time, suggesting potential peak engagement periods

## Insights & Analysis Page

(fig2: Factors influencing total purchases)

## Key Influencers Analysis

This page uses the Key Influencers visual in Power BI to identify factors affecting total purchases. The analysis shows that higher bounce rate significantly decreases total purchases, making it one of the most important negative factors. It also highlights other contributing factors such as changes in user visits and engagement levels.

## Conclusion

The ConvertIQ dashboard provides a clear view of user behavior, traffic sources, and conversion performance.

It helps identify key factors such as bounce rate and traffic quality that impact conversions, enabling better data-driven decision-making and optimization of website performance.
